                                                                                                                                                                                    following preference: calcium > manganese > magnesium > zinc.
Seems to bind to collagen type IV and laminin.
SUBCELLULAR LOCATION: Type I membrane protein (isoforms 1 and 2).
Secreted (isoform 3). Isoform 1 is expressed at the cell surface while isoform 2 is predominantly expressed within the endoplasmic reticulum and not at the plasma membrane.

Note=No experimental confirmation available;
TISSUE SPECIFICITY: Expressed in colon, heart,
liver, peripheral blood leukocytes, placenta, i
small intestine and spleen.
DOMAIN: Binding to PA seems to be effected thre
SIMILARITY: Belongs to the ATR family.
SIMILARITY: Contains 1 VWFA domain.

"Cloning of rat alpha D, a novel beta 2 integrin.";
Submitted (AUG-1997) to the EMBL/GenBank/DDBJ databases.

1. FUNCTION: Integrin alpha-D/beta-2 is a receptor for ICAM3 and VCAM1. May play a role in the atheroselerotic process such as clearing lipoproteins from plaques and in phagocytosis of bloodborne pathogens, particulate matter, and senescent erythrocytes from the blood (By similarity).

1. SUBUNIT: Heteorodimer of an alpha and a beta subunit. Alpha-D associates with beta-2 (By similarity).

1. SUBCELIULAR LOCATION: Type I membrane protein (By similarity).

1. DOMAIN: The integrin I-domain (insert) is a VWFA domain. Integrir with I-domains do not undergo protease cleavage.

1. SIMILARITY: Belongs to the integrin alpha chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pfam; PI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     submitted (AUG-2001) to the EMBL/GenBank/DDBJ EMBL; BC012475; AAH12475.1; -.

Med. 188:2187-2191(1998).
FUNCTION: Integrin alpha-D/beta-2 is a receptor for ICAM3 and VCAM1. May play a role in the atherosclerotic process such as clearing lipoproteins from plaques and in phagocytosis of bloodborne pathogens, particulate matter, and senescent erythrocytes from the blood.

SUBUNIT: Heterodimer of an alpha and a beta subunit. Alpha-D associates with beta-2.

SUBCELLULAR LOCATION: Type I membrane protein.

TISSUB SPECIFICITY: Expressed moderately on myelomonocytic cell lines and subsets of peripheral blood leukocytes and strongly on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2-integrin alpha subunit.";

atherosclerotic plaques, and on splenic red pulp macrophages.
DOMAIN: The integrin I-domain (insert) is a VWFA domain. Inte
with I-domains do not undergo protease cleavage.
SIMILARITY: Belongs to the integrin alpha chain family.
SIMILARITY: Contains 7 FG-GAP repeats.
SIMILARITY: Contains 1 VWFA domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GO:0008305; C:integrin complex; TAS. Proc. Natl. Acad. Sci. U.S.A. 95:4870-4875 [1998].

-I- FUNCTION: Integrin alpha-M/beta-2 is implicated in various adhesive interactions of monocytes, macrophages and granulocytes as well as in mediating the uptake of complement-coated particles. It is identical with CR-3, the receptor for the iCD5 fragment of the third complement component. It probably recognizes the R-G-D peptide in C3b. Integrin alpha-M/beta-2 is also a receptor for fibrinogen, factor X and ICAM1. It recognizes P1 and P2 peptides of fibrinogen gamma chain.

-ISUSUNIT: Heterodimer of an alpha and a beta subunit. Alpha-M
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ÷

With I-domains do not undergo protease cleavage. SIMILARITY: Belongs to the integrin alpha chain family. SIMILARITY: Contains 7 FG-GAP repeats. SIMILARITY: Contains 1 VWFA domain. SIMILARITY: Contains 1 VWFA domain. DATABASE: NAME-PROW; NOTE=CD guide CD11b entry; WWW-"http://www.ncbi.nlm.nih.gov/prow/cd/cdllb.htm".
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    granulocytes.

The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alaheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the cutilisation of the activities such as: Immune system suppression, activiny, in activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S. disorders. Note: The sequence data for this patent did not form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

The polypeptide of the invention demonstrates antibacterial activities whilst the composition and method may be useful in preventing or amellorating the symptoms of cutaneous and/or inhalation anthrax. The current sequence is that of the human

Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising mature human TANGO197, thrombin cleavage site and his tag that can be used to treat exposure to or prevent a symptom of anthrax.
                                                                                                                                                                                                                                                                                                                                                                                                                                    TANGO, 128, 140, 197, 212, 213, 224; 239, modulating agent; asthma; graft versus-host diseases; rheumatoid arthritis; psoriasis; inflammatory bowel disease; septic shock; ulcerative colities; Crohn's disease; chronic myelogenous leukemia; cancer; liver disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Lyme's disease, cachexia and autoimmune diseases e.g. myasthemia gravis, autoimmune diabetes and systemic lupus crythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in forensic biology, for diagnostic assays, pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range of cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, remumatoid arthritis, psoriasis, inflammatory bowel disease, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel nucleic acid sequences encoding TANGO-128, and 239 polypeptides useful for the treatment of arthritis, psoriasis and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2000-465743/40.

The 2 polypeptides are identical between amino acids 1-317, but differ thereafter at the C-care identical between amino acids 1-317, but differ thereafter at the C-care identical between amino acids 1-317, but differ thereafter at the C-care identical between amino acids 1-317, but differ thereafter at the C-care identical provides and provides and provides and provides and provides and provides and provides and polypeptides and college identification that it can be a complete or partial ATR. The invention provides ATR polypeptides and CC polynucleotides, vectors, host cells, and transgenic and knock-out animals. It also provides methods for identifying molecules that bind the CC animals. It also provides methods for identifying molecules that bind the CC arithmethod for treating anthrax in a human or animal involves administering an agent CC treating anthrax in a human or animal involves administering an agent that inhibits binding between anthrax toxin protective antigen (PA) and ATR at a level effective to reduce the severity of anthrax. Suitable agents include the present polypeptide or a PA-binding fragment of it, a pa-binding polypeptide at least 80% identical to these, a fusion protein, a monoclonal or polyclonal antibody, a polysaccharide, a lipid or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel fusion polypeptide comprising a von Willebrand factor A-like domain (vWP) amino acid sequence and an amino acid sequence heterologous to the vWF. The polypeptide of the invention demonstrates antibacterial activities whilst the composition and method may be useful in preventing or ameliorating the symptoms of cutaneous and/or inhalation anthrax. The current sequence is that of the human TANGO 197 protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a fusion polypeptide comprising a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous to the vWF. Also described ser: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a human von Willebrand factor A-like domain (vWF) amino acid sequence TANGO197.
                               Human TANGO 197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New TANGO 197 and/or TANGO 216 fusion polypeptides for preventing or ameliorating symptoms of anthrax comprises a von Willebrand factor A-lik domain (vWP) amino acid sequence and an amino acid sequence heterologous

                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel fusion polypeptide comprising a von Willabrand factor A-like domain (vWP) amino acid sequence and an amino acid sequence heterologous to the vWF. The polypeptide of the invention demonstrates antibacterial activities whilst the composition and method may be useful in preventing or ameliorating the symptoms of cutaneous and/or inhalation anthrax. The current sequence is that of the human TANGO 197 FLAG fusion protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (ROTT/) ROTTMAN J B.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ameliorating domain (vWF) to the vWF.
                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a fusion polypeptide comprising a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous to the vWF. Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197 and FLAG that can be used to treat exposure to or prevent a symptom of anthrax.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   antibacterial; gene therapy; von Willebrand factor A-like domain amino acid sequence; vWF amino acid sequence; anthrax; Bacillus anthracis; cutaneous anthrax; inhalation anthrax; human; TANGO197; FLAG; fusion protein; gene.

                                                                                                                                                                                                                                              The invention relates to a novel fusion polypeptide comprising a von Willebrand factor A-like domain (vWP) amino acid sequence and an amino acid sequence heterologous to the vWF. The polypeptide of the invention demonstrates antibacterial activities whilst the composition and method may be useful in preventing or ameliorating the symptoms of cutaneous and/or inhalation anthrax. The current sequence is that of the human TANGO 197 HiaTag fusion protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                        New TANGO 197 and/or TANGO 216 fusion polypeptides for preventing or ameliorating symptoms of anthrax comprises a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens.

                                                                                                                                                                                                                                                                       The invention describes a fusion polypeptide comprising a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous to the vWF. Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197, thrombin cleavage site and his tag that can be used to treat exposure to or prevent a symptom of anthrax.

Anthrax toxin protective antigen (PA) binds to the ATR at a von Willebrand factor A domain located in the extracellular domain of ATR. The invention provides ATR polypeptides and polymucleotides, vectors, host cells, and transgenic and knock-out animals. It also provides methods for identifying molecules that bind the ATR and which reduce the toxicity of anthrax toxin. A claimed method for treating anthrax in a human or animal involves administering an agent that inhibits binding between PA and ATR at a level effective to reduce the severity of anthrax. Sultable agents include ATR or a PA-binding fragment of ATR, a PA-binding polypeptide at least 80% identical to these, a fusion protein, a monoclonal or polyclonal antibody, a polysaccharide, a lipid or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibacterial; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a fusion polypeptide comprising a von Willebrand factor A-like domain (vWF) amino acid sequence and an amino acid sequence heterologous to the vWF. Also described are: a method of preventing or ameliorating a symptom of anthrax in a subject thought to be at risk for exposure to or suspected of having been exposed to Bacillus anthracis; and a pharmaceutical composition comprising the novel fusion polypeptide. The composition and method are useful in preventing or ameliorating symptoms of cutaneous and/or inhalation anthrax. This is the amino acid sequence of a fusion protein comprising human TANGO197 extracellular region, minus the DG residues closest to the transmembrane region, and immunoglobuling (IGG) fragment of crystallisation (FC) with mutations
